BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problem Mailbox.

Sequences AAW95463-471 represent LS170 polypeptide fragments which CC contain at least on epitope in their sequences. The present invention CC relates to detection of a target LS170 polypucleotide that comprises treating a test sample with at least one LS170-specific nucleic acid that has at least 50 percent identity with any of the sequences (AAXO0801-09) CC which are fragments derived from various clones of LS170 gene. The LS170 nucleic acid fragments represent a set of contiguous, partially CC overlapping sequences transcribed from lung tissue. They are used for CC diagnosis, staging, monitoring, in vivo imaging, prevention and treatment CC in ung disease, specifically cancer, and to indicate predisposition to such disease, specifically cancer, and to indicate predisposition to Such disease. Particularly detection of LS170 polynucleotide, LS170 antigens, or anti-LS170 antibodies is indicative of disease. Cells transformed with an expression system comprising the LS170 nucleic acid sequences are used to express recombinant polypeptides. The polypeptides are used to raise Ab and for drug screening, LS170-related nucleic acid can be used to isolate related sequences; as standards and reagents in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAW95467

                                                                       Sequences AAW95463-471 represent LS170 polypeptide fragments which contain at least on epitope in their sequences. The present invention relates to detection of a target LS170 polypucleotide that comprises treating a test sample with at least one LS170 specific nucleic acid that has at least 50 percent identity with any of the sequences (AAX00801-09) which are fragments derived from various clones of LS170 gene. The LS170 nucleic acid fragments represent a set of contiguous, partially overlapping sequences transcribed from lung tissue. They are used for diagnosis, staging, monitoring, in vivo imaging, prevention and treatment of lung disease, specifically cancer, and to indicate predisposition to such disease. Particularly detection of LS170 polypucleotide, LS170 antipens, or anti-LS170 antibodies is indicative of disease. Cells transformed with an expression system comprising the LS170 nucleic acid
          sequences are used to express recombinant polypeptides. The polypeptides are used to raise Ab and for drug screening. LS170-related nucleic acid can be used to isolate related sequences; as standards and reagents in assays; as targets for drug screening, and as components or targets for
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Billing-medel PA, Cohen M, Colpitts TL, Fr Gordon J, Granadosen, Hodges SC, Klass MR, Roberts-rapp L, Russell JC, Stroupe SD;

                                                        Sequences AAW95463-471 represent LS170 polypeptide fragments which contain at least on epitope in their sequences. The present invention relates to detection of a target LS170 polypucleotide that comprises treating a test sample with at least one LS170-specific nucleic acid that has at least 50 percent identity with any of the sequences (AAX00801-09) which are fragments derived from various clones of LS170 gene. The LS170 culleic acid fragments represent a set of contiguous, partially converlapping sequences transcribed from lung tissue. They are used for coverlapping sequences transcribed from lung tissue. They are used for content of lung disease, specifically cancer, and to indicate predisposition to such disease. Particularly detection of LS170 polynucleotide, LS170 cantigens, or anti-LS170 antibodies is indicative of disease. Cells care used to expression system comprising the LS170 nucleic acid con be used to raise Ab and for drug screening. LS170-related nucleic acid can be used to isolate related sequences; as standards and reagents in the polypeptides. The polypeptides of the sequences are as anti-care of ring screening, and as components or targets for Ab an heavy sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAM33515 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                                                                                   The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived
                                                                                                                                                                                                         Penn
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAM33515;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                               AAM30376;
                                                                                                                     AAM30376 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 27; SEQ ID No 22695; 487pp; English.

                                                                                                                                                                                                                                                                                                                                                    The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of

The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic aetiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative breast diseases, proliferative

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a novel human secreted protein, termed cnh796_1. The sequence is predicted from a full-length cDNA clone (see AAX59356) isolated from a human adult brain (thalamus) cDNA clibrary. The invention provides cDNA clones (see AAX59352-58) encoding novel secreted proteins (see AAX06404-10) of the human cestis, brain and foetal kidney. The polynucleotides and proteins are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data are provided. Suggested activities include nutritional, cytokine, cell proliferation or differentiation, immunostimulatant (e.g. as vaccine) or immunosuppressive, haematopoiesis regulating, tissue growth, activin or inhibin, chemotactic or chemokinetic, thrombolytic, receptor/ligand, antiinflammatory, catherin or tumour invasion suppressor, and tumour inhibition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequences AAW95463-471 represent LS170 polypeptide fragments which CC contain at least on epitope in their sequences. The present invention CC relates to detection of a target LS170 polynucleotide that comprises CC treating a test sample with at least one LS170-specific nucleic acid that CC which are fragments derived from various clones of LS170 gene. The LS170 coverlaping sequences transcribed from lung tissue. They are used for CC diagnosis, staging, monitoring, in vivo imaging, prevention and treatment CC of lung disease, specifically cancer, and to indicate predisposition to coverlapens, or anti-LS170 antibodies is indicative of disease. Cells CC transformed with an expression system comprising the LS170 nucleic acid cequences are used to express recombinant polypeptides. The polypuctides are used to raise Ab and for drug screening. LS170-related nucleic acid can be used to isolate related sequences; as stargets for drug screening, and as components or targets for therapy, e.g. as antisense, ribozyme or triplex-forming agents. Ab can be competitive binding drug screens, and to generate anti-idiotypic competitive binding drug screens, and to generate anti-idiotypic competitive binding drug screens, and to generate anti-idiotypic competitive binding drug screens, and to generate anti-idiotypic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The specification describes methods for diagnosing the presence of lung cancer in a patient. The method comprises measuring levels of lung specific genes in cells, tissues or bodily fluids, and comparing the level to that of a normal human control. The methods can be used for diagnosing, monitoring, staging or prognosticating lung cancer, especially metastatic lung cancer. Antibodies against proteins encoded by lung specific genes can be used for imaging or, when conjugated to a cytotoxic agent, for

Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as
                                      gene
                                                                                                                                                                                                                   Polynucleotide encoding LUNX gene product useful for cancer especially micrometastatic cancer \,
                                                                                                                                                                                                                                                                                                                                                                                                                            07-SEP-1999;

lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, heamostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and

immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic

The invention relates to human nucleic acids (AAI57798-AAI61369) the encoded polypeptides (AAN38642-AAM42213) with nootropic,

  The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as alzhelmer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, activity, hemocractic/chemokinetic activity, hemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and

     The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the

The HSPHH-1 polynucleotide was isolated from the BRAITUT21 CDNA library constructed from cancerous brain tissue. The HSPHH-2 DNA Sequence was isolated from the BRSTNOT18 CDNA library constructed from the BRSTNOT18 CDNA library constructed from the Sequence was isolated from the BRSTNOT18 CDNA library constructed from the BRSTNOT18 CDNA library constructed from the Sequences and their complements of conditions or disorders associated with HSPHH Complements are also useful as antagonists for prevention or treatment of cancer e.g. adenocarcinoma, breast and skin, and inflammation associated with e.g. AIDS, Crohn's disease and callergies. HSPHH-1 and HSPHH-2 are useful for drug screening using allergies. HSPHH-1 and HSPHH-2 are useful for drug screening using libraries of compounds. The HSPHH-1, HSPHH-2 nucleotide sequences, and their complements, are useful for detecting upstream sequences are useful for the preparation of HSPHH proteins and mRNA caches.

                                                                                                                                                                                                  Ş
                                                                                                                            RESULT
                                                                                                                                                                                                                                                                                                                             CC full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of cc oligonucleotide sequences defined in the specification, where the cc onligonucleotide comprises at least 15 nucleotides; or (b) a combination of a polynucleotide which comprises a 5'-end cc of an oligonucleotide comprising a sequence complementary to the cc sequence and an oligonucleotide comprising a sequence complementary to a combination of complementary to the comprises a 5'-end cc oligonucleotide which comprises a 5'-end sequence, where the cc oligonucleotide comprises a 3'-end sequence, where the cc oligonucleotide comprises a 1'-end sequence, where the cc in gene therapy. The primer sets can be used in antisense therapy and cc in gene therapy. The primers are useful for synthesising polynucleotides, and classification and/or diagnosis of the abnormality of the proteins encoded by comparison and comparison of the abnormality of the proteins encoded by comparison to an analysis of the primers allow obtaining of the full-length cC comparison thuman cDNAs equences; AAB92446 to AAB13633 to AAB13642 represent human acid sequences; AAB92446 to AAB13632 cr the full-length class, all of which are used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                            CC This polypeptide, designated bp537_4, comprises a novel human CC secreted protein that is encoded by a cDNA clone (see AAV58758) CC isolated from a human foetal kidney cDNA library. Homology is shown to some database sequences. The invention provides isolated polynucleotides (see AAV58754-63) obtained from human adult testis, brain, retina or placenta, or from foetal kidney or brain cDNA libraries. These are all deposited as ATCC 98353. They encode novel human secreted proteins (see AAW69423-33) that may have e.g. nutritional activity, immune stimulating or suppressing activity, haematopoiesis regulating activity, tissue growth activity, haematopoiesis regulating activity, tissue growth activity, activiny, inhibin activity, chemotactic/chemokinetic activity, antimilammatory activity, cadherin/tumour invasion suppressor activity, tumour inhibition or other activities. They may also be used for diagnostic purposes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes primer sets for synthesising 5602 CC full-length cDNAs defined in the specification. Where a primer set CC comprises: (a) an oligo-dr primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide comprises at least 15 nucleotides; or (b) a combination CC of an oligonucleotide comprises a sequence complementary to the CC complementary strand of a polynucleotide which comprises a 5 end CC complementary to a combination of complementary strand of a polynucleotide which comprises a 5 end CC complementary to a combination of complementary to a complementary and the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Ma

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of
                                                              Primer sets for synthesizing polynucleotides, particularly tfull-length cDNAs defined in the specification, and for the and/or diagnosis of the abnormality of the proteins encoded full-length cDNAs -

The primer sets can be used in antisense therapy and in gene therapy. The primers sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH3633 to AAH18742 represent human cDNA sequences; AAB92446 to AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent cligonucleotides, all of which are used in the exemplification of the present invention.
              AAH52304 to AAH53970 represent nucleic acids (I) encoding polyp (II), given in AA681454 to AA683120, from Staphylococcus epider (I) and (II) can have antibacterial acity try and therefore can in vaccination. The nucleic acids (I) may be used to produce the sepidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which exp
                                                                                                                                                                 Nucleic acids encoding useful for vaccinating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55098 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention.

N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing only goes up to SEQ ID NO.4454 so even though sequences are given in the disclosure for SEQ ID NO.4454 to 4472, no sequences are present for SEQ ID NO.4455 to 4461.
                                                                                                                                                             Tang

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to human nucleic acids (AAI57798-AAI61369) and CC the encoded polypeptides (AAAJ8642-AAAJ2213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful CC in gene therapy. A composition containing a polypeptide or polynucleotide CC of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and CC claised neuropathies and central nervous system diseases, such as CC Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic CC lateral sclerosis, and Shy-Drager Syndrome. Other uses include the CC utilisation of the activities such as: Immune system suppression, CC activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic CC and thrombolytic activity, cancer diagnosis and therapy, drug screening, CC assays for receptor activity, arthritis and inflammation, leukaemias and CC N.S disorders.

CC Note: The sequence data for this patent did not form part of the printed CC specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cc sequence and an oligonucleotide which comprises a 5'-end cc polynucleotide which comprises a 3'-end sequence complementary to a composition of comprises a 3'-end sequence, where the combination of composition of comprises at least 15 nucleotides and the combination of the 5'-end sequence, and sequence is selected from those defined in cc the specification. The primer sets can be used in antisense therapy and cc in gene therapy. The primers are useful for synthesising polynucleotides, cc particularly full-length cDNAs. The primers are also useful for the cc detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13638 and Cc AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to cc AAB95893 represent human amino acid sequences; AAB92446 to cc AAB95893 represent human amino acid sequences; AAB92446 to cc of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAY84686

This invention describes a novel polynucleotide isolated from human immunodeficiency virus type I subtype C/B', which can be used for the induction of specific humoral and the immune responses. (I) and polypeptides (II) encoded by them, are useful in pharmaceuticals, vaccines and diagnostic agents, particularly for treatment or prevent of human immune deficiency virus-1 (HIV-1) infections, also for ratio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              with fungicidal activity can be used for suppressing fungal growth, especially of filamentous fungi. Fungi that can be suppressed incluplant pathogens (e.g. Septoria tritici, Stagnospora nodorum, and Magnaporthe grisea) and human pathogens (e.g. Candida albicans, and Aspergillus fumigatus).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                binding protein genes, recomposition of the protein gene, and a putative cytokenesis gene. These genes are protein gene, and a putative cytokenesis gene. These genes are essential for fungal growth and development. The proteins can be used in methods to identify compounds that have fungicidal activity. Compounds in methods to identify compounds that have fungicidal activity. Compounds in methods to identify compounds that have fungicidal activity.
                                                                                                 Disclosure;
                                                                                                                                    New nucleic acid sequences from a human immune deficiency virus intersubtype, useful for treatment, prevention and diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            binding

                                    of a phenylalanine dehydrogenase protein, pdh, from Rhodococcus sp. M4.
The encoding pdh nucleic acid is used to produce recombinant Rhodococcus L-phenylalanine dehydrogenase, which can be used to produce L-mino acids from the corresponding alpha-keto acids, e.g. to produce L-phenylalanine from phenylpyruvic acid (e.g. for the production of aspartame), to screen for phenylketonuria in newborn infants and to monitor the efficacy of

                                                                                         This sequence represents a Staphylococcus aureus protein of unknown function, and is encoded by a DNA sequence of the invention.

The DNA sequences were isolated from Staphylococcus aureus WCHU29 (NCIMB 40771). Host cells containing the DNA sequences are used to produce polypeptides or fragments. The proteins are used in the treatment of disease, for inducing an immune response by administering them, to produce antibody and/or T-cell immune response. Antagonists of the proteins are used for the inhibition of bacterial polypeptides. Conditions which may be treated include bacterial infections, especially respiratory, cardiac, gastrointestinal, central nervous, eye, kidney, urinary tract, skin, bones and joints. The proteins can also be used to identify antimicrobial compounds which are broad spectrum antibiotics, especially useful in the treatment of H. pylori infection.

                                                                                                                                                                                                                   This sequence is used to describe a method which results in the isolation of a phenylalanine dehydrogenase protein, pdh, from Rhodococcus sp. M4. The encoding pdh nucleic acid is used to produce recombinant Rhodococcus L-phenylalanine dehydrogenase, which can be used to produce L-mino acids from the corresponding alpha-keto acids, e.g. to produce L-phenylalanine from phenylpyruvic acid (e.g. for the production of aspartame), to screen for phenylaketonuria in newborn infants and to monitor the efficacy of low-phenylalanine diets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Phenylalanine dehydrogenase; pdh; L-amino acid; phenylpyruvic acid; aspartame production; phenylketonuria; infant; alanine dehydrogenase; diet.
                                                                                                                                                                                                                                                                                                                                                                                                                                               {\tt DNA} encoding Rhodococcus L-phenylalanine dehydrogenase -production of recombinant enzyme
                                                                                                                                                                                   Sequence

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  B B

C I SUBUNIT: HETEROTETRAMER OF TWO TYPE I AND TWO TYPE II KERATINS.

C II SUBUNIT: HETEROTETRAMER OF TWO TYPE II KERATINS.

C II SUBUNIT: HETEROTETRAMER OF TWO TYPE II KERATINS.

C INTISSUE SPECIFICITY: CORNEA-SPECIFIC.

C INTERIOR CORNEAL DYSTANDIA DATA DE SEASE THAT CAUSES FRAGILITY OF THE COLOR.

C INTERIOR CORNEAL EPITHELIUM. PATIENTS ARE USUALLY ASYMPTOMATIC UNTIL ADULTHOOD WHEN RUPTURE OF THE CORNEAL MICROCYSTS MAY CAUSE CONTROL AND INTERMITTENT DIMINUTION OF VISUAL ACUITY.

CC EROSIONS, PRODUCING CLINICAL SYMPTOMS SUCH AS PHOTOPHOBIA, CONTACT LENS INTOLERANCE AND INTERMITTENT DIMINUTION OF VISUAL ACUITY.

CC RARELY, SUBEPITHELIAL SCARRING CAUSES IRREGULAR CORNEAL ACUITY.

CC RARELY, SUBEPITHELIAL SCARRING CAUSES IRREGULAR CORNEAL CONTROL ASTIGMATION SHOWS A DISORGANIZED AND THICKENED EPITHELIUM WHITH CC EXAMINATION SHOWS A DISORGANIZED AND THICKENED EPITHELIUM WHITH CC DEBRIS-LADEN INTRAEPITHELIAL CYSTS.

CC INDICATE THERE ARE TWO TYPES OF CYTOSKELETAL AND MICROFIBRILIAR KERATIN: I (ACIDIC; 40-55 KDA) [K9 TO KZO] AND II CRC (NEUTRAL TO BASIC; 56-70 KDA) [K1 TO K8]
